Executive Summary

The 2019 IronPeak Full Distance Triathlon delivered a strong overall outcome, with 92.77% of participants completing the race. However, performance and completion patterns varied substantially across athlete segments and markets, particularly between professional and amateur athletes and across countries and divisions. These differences suggest that overall event performance should be evaluated through a segmented lens rather than relying solely on aggregate results.

Key Findings

- 1. Strong overall completion
92.77% completion rate
2,258 of 2,434 participants completed the race.
- 2. Professionals showed a markedly different race profile
18.75% DNF vs. 3.42% among amateurs
Professionals also averaged **8:59** versus **11:31** for amateurs.
- 3. Participation volume did not consistently align with performance
USA: 650 participants | 12:13 average finish
Germany: 277 participants | 10:59 average finish
The largest participant market did not have the strongest average performance.
- 4. Performance varies substantially across divisions
8.5 hrs → 11.1 hrs
Fastest vs. slowest division
Average finish time varies considerably by division
Participant composition should be considered when interpreting overall event performance.

Recommendations

1. Establish a separate performance and completion review for professional athletes

Analyze professional athletes separately from the amateur field, focusing on the race-stage patterns associated with their substantially higher DNF rate.

2. Use participant-market and performance data together in country-level planning

Evaluate country markets using both participant volume and athlete performance rather than participation volume alone.

3. Segment performance reporting by division

Use division-level performance benchmarks when evaluating athlete performance and planning future participant strategies.

Scope & Limitations

- **Single-event analysis:** Findings are based on one edition of the IronPeak Full Distance Triathlon.
- **Descriptive analysis:** Results identify patterns and differences but do not establish causal relationships.
- **No external benchmarking:** The analysis does not compare results with previous editions or external events.
